

Use Case Template:

Template: Update Menu

ID:	UC-02
Title:	Update Menu
Description:	This use case allows the restaurant manager to add, remove, or modify food items in the menu. It ensures that customers always see the latest available dishes and their prices.
Primary Actor:	Manager
Secondary Actor:	RMS
Preconditions:	1.The manager must be logged into the system. 2.The system must have an existing menu database.
Postconditions:	1.The menu is updated and displayed to customers. 2.Any removed or unavailable items are no longer visible to customers.
Dependency	None
Generalization	None
Main Success Scenario:	1. Manager logs in to the restaurant management system. 2. Navigates to the " Menu Management " section. 3. Selects an option to Add, Edit, or Remove menu items. 4. If adding a new item: - Manager enters item name, description, price, category (starter, main course, dessert, etc.), and availability. - System saves the new item. 5. If editing an item: - Manager selects an existing item and updates its details (e.g., price, description, availability). - System saves changes. 6. If removing an item: - Manager selects an item to delete. - System removes it from the menu. 7. System updates the menu in real-time for customer access.
Extensions or Alternate Flow:	- If a menu item is unavailable (out of stock): 1. Manager can mark it as temporarily unavailable instead of deleting it. - If an invalid price is entered: 1.System prompts for correction. - If the manager attempts to remove an item linked to existing orders: 1.System prevents deletion and provides a warning.
Frequency of Use:	Weekly or as needed when menu changes.
Status:	In Development
Owner:	Project Team
Priority:	Medium
